

SY7120

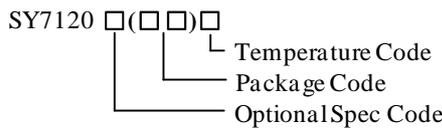

High Efficiency, 16V, 10A Synchronous Step Up Regulator Advanced Design Specification

General Description

SY7120 develops a high efficiency, high power density synchronous Boost regulator. The device adopts adaptive constant OFF time and current mode control. The integrated low $R_{DS(ON)}$ switches minimize the conduction loss.

SY7120 provides selectable PFM/PWM light load operation mode. The device features cycle by cycle peak current limit. Low output voltage ripple and small external inductor and capacitor size are achieved with programmable pseudo-constant frequency.

Pin Name	Pin Number	Pin Description
BS	1	Boost-strap pin. Supply Rectifier FET's gate driver. Decouple this pin to the LX pin with a 0.1μF ceramic capacitor
OUT	2,3,4,5	The Boost converter output pin.
LX	6,19,20	Inductor node. Connect an inductor from power input to the LX pin.
GND	7,8,18	Ground pin of the IC.
ILMT	5	Switch peak current limit setting. Connect a resistor from this pin to GND. $I_{LMT}(A) = 1200/R_{ILMT}(k\Omega) - 2$
NC	10,16	Not connected.
FB	11	Feedback pin. Connected to the center of resistor voltage divider to program the output voltage: $V_{OUT} = 1V \times (R_1/R_2 + 1)$
FS	12	Switching frequency setting pin. Connect a resistor from this pin to ground to program the switching frequency. $f_s(kHz) = 73565/R_{FS}(k\Omega) + 300$
MODE	13	Operating mode selection under light load. Pull this pin low for PFM operation, and pull this pin high or leave it floating for PWM operation.
EN	14	Enable control. Pull high to turn on the IC. Do not leave it floating.
SVIN	15	IC power supply input pin. Decouple this pin to the GND pin with a 1μF ceramic capacitor.
VCC	17	Output of the internal regulator. Decouple this pin to the GND pin with a 1μF ceramic capacitor.

Note 1: Stresses beyond the “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only. Functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

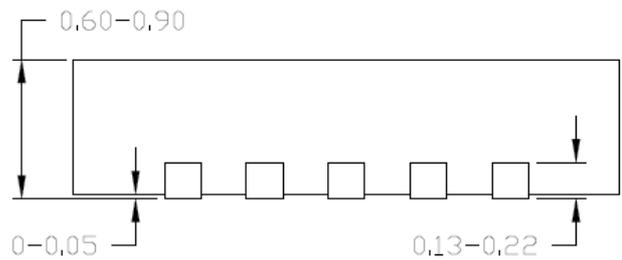

Note 2: θ_{JA} is measured in the natural convection at $T_A=25^{\circ}C$ on a low effective single layer thermal conductivity test board of JEDEC 51-3 thermal measurement standard. Paddle of QFN3x3-20 package is the case position for θ_{JC} measurement.

Note 3: The device is not guaranteed to function outside its operating conditions.
