**Preliminary Datasheet 1.4**

**FEATURES and FUNCTIONAL DIAGRAM**

- AEC-Q100 automotive qualified
- Digital Bipolar-Latch Hall Sensor
- Multiple Sensitivity Options (BOP / BRP):  
+15 / -15 Gauss; +30 / -30 Gauss; +45 / -45 Gauss; +120 / -120 Gauss;
- Chopper stabilization for stable operate points throughout operating temperature range
- On board voltage regulator for 2.5V to 22V range
- Resistant to physical stress
- Output short-circuit protection
- Operation from unregulated supply
- Reverse-battery and freewheeling protection
- Solid-state reliability
- Wide Operating temperature range: -40 to 150 °C
- Small package sizes TO-92S, SOT-23 and SOT-89
- RoHS-compliant material meets directive 2011/65/EU

**PACKAGE**

**APPLICATIONS**

- Speed and RPM sensing
- Tachometer, counter pickup
- Flow-rate sensing
- Brushless dc (direct current) motor commutation
- Motor and fan control
- Robotics control

**DESCRIPTION**

The CH441/CH442/CH443/CH444 Hall-effect sensor is extremely temperature-stable and stress-resistant sensor ICs, especially suited for operation over extended temperature ranges from -40°C to 150°C. Superior high temperature performance is possible through dynamic offset cancellation, which reduces the residual offset voltage normally caused by device over-molding, temperature dependencies, and thermal stress.

The device includes a voltage regulator, Hall-voltage generator, small-signal amplifier, chopper stabilization, Schmitt trigger, and a short circuit protected open-drain output to sink up to 25 mA.

An on-board regulator permits operation with supply voltages of 2.5 to 22 V. The advantage of operating down to 2.5V is that the device can be used in 2.5V applications or with additional external resistance in series with the supply pin for greater protection against high-voltage transient events.

The CH441/CH442/CH443/CH444 series is latch Hall switch. For the latch mode, there are also invert polarity devices. Normally a south pole of sufficient strength turns on the output; However, for invert polarity devices, a north pole of sufficient strength turns on the output.

The CH441/CH442/CH443/CH444 also integrated internal clamps against supply/output transients; output short circuits protection; reverse battery conditions.

Three package styles provide a magnetically optimized package for most applications, SOT-23, TO-92S and SOT-89. Each package type is lead (Pb) free (suffix, . T), with a 100% matte-tin-plated lead-frame.

## 2. Pin Definitions and Descriptions

SOT-23-3L (S)	TO-92S (T)	SOT-89-3L (E)	Name	Type	Function
1	1	1	VDD	Supply	Supply Voltage pin
2	3	3	OUT	Output	Open Collector Output pin
3	2	2	GND	Ground	Ground pin

**SOT-23-3L**

**TO-92S**

**SOT-89-3L**

## 3. Absolute Maximum Ratings

Parameter	Symbol	Min	Max	Units
Supply Voltage	$V_{DD}$	-	24	V
VDD Reverse Voltage $V_{DD}$	$V_{RDD}$	-22		V
Supply Current	$I_{DD}$	-	20	mA
Output Voltage	$V_{OUT}$	-0.3	24	V
Output Current	$I_{OUT}$	-	25	mA
Operating Ambient Temperature	$T_A$	-40	150	°C
Storage Temperature	$T_S$	-50	150	°C
Junction temperature	$T_J$	-50	165	°C
Magnetic Flux	B	No Limit		Gauss

Note: Exceeding the absolute maximum ratings may cause permanent damage. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

## 4. ESD Protections

Parameter	Value	Unit
All pins <sup>1)</sup>	+/-8000	V
All pins <sup>2)</sup>	+/-200	V
All pins <sup>3)</sup>	+/-750	V

1) HBM (Human Body Mode) according to AEC-Q100-002

2) MM (Machine Mode) according to AEC-Q100-003

3) CDM (charged device mode) according to AEC-Q100-011

**5. Function Description**

The CH441/CH442/CH443/CH444 exhibits latch magnetic switching characteristics. Therefore, it requires both south and north poles to operate properly.

The device behaves as a latch with symmetric operating and release switching points ( $BOP=|BRP|$ ). This means magnetic fields with equivalent strength and opposite direction drive the output high and low.

Removing the magnetic field ( $B = 0$ ), it keeps the output in its previous state. This latching property defines the device as a magnetic memory.

A magnetic hysteresis BHYST keeps BOP and BRP separated by a minimal value. This hysteresis prevents output oscillation near the switching point.

**6. Magnetic Activation**

**7. Temperature Characteristics**

(1) 1 mT = 10 Gauss

(2) Bandwidth describes the fastest changing magnetic field that can be detected and translated to the output.

**NOTICE**

The magnetic field strength (Gauss) required to cause the switch to change state (operate and release) will be as specified in the magnetic characteristics. To test the switch against the specified magnetic characteristics, the switch must be placed in a uniform magnetic field.

**9. Application Information**

**9.1 Typical Application**

It is recommended that an external capacitor C1 is connected to the supply. This can reduce the noise injected into the device. Normal 0.1uF is suggested.

Typical Application Circuit

**9.2 Device Output**

If the device is powered on with a magnetic field strength between BRP and BOP, then the device output is indeterminate and can either be Hi-Z or Low. If the field strength is greater than BOP, then the output is pulled low. If the field strength is less than BRP, then the output is released.

**9.3 Output Stage**

The CH44X output stage uses an open-drain NMOS, and it is rated to sink up to 30 mA current. For proper operation, calculate the value of the pullup resistor R1 using Equation 1.

$$\frac{V_{ref\ max}}{30\ mA} \leq R1 \leq \frac{V_{ref\ min}}{100\ \mu A} \quad (1)$$

The size of R1 is a tradeoff between the OUT rise time and the current when OUT is pulled low. A lower current is generally better, however faster transitions and bandwidth require a smaller resistor for faster switching. In addition, ensure that the value of R1 > 500 to ensure the output driver can pull the OUT pin close to GND.

**Preliminary Datasheet 1.4**

Select a value for C2 based on the system bandwidth specifications as shown in [Equation 2](#).

$$2 \times f_{BW} \text{ (Hz)} < \frac{1}{2\pi \times R1 \times C2} \quad (2)$$

Most applications do not require this C2 filtering capacitor.

**9.4 Protection Circuits**

The CH44X device is fully protected against overcurrent and reverse-supply conditions.

**9.5 Overcurrent Protection (OCP)**

An analog current-limit circuit limits the current through the FET. The driver current is clamped to IOCP. During this clamping, the rDS(on) of the output FET is increased from the nominal value.

**9.6 Reverse Supply Protection**

The CH44X device is protected in the event that the VCC pin and the GND pin are reversed (up to . 22 V).

**9.7 Alternative Two-Wire Application**

For systems that require minimal wire count, the device output can be connected to VCC through a resistor, and the total supplied current can be sensed near the controller.

**2-Wire Application**

Current can be sensed using a shunt resistor or other circuitry.

### 10. Test Conditions

Note: DUT=Device Under Test

#### Supply Current

Note 1 - The supply current  $I_{DD}$  represents the static supply current. OUT is left open during measurement

Note 2 - The device is put under magnetic field with  $B < B_{RP}$

#### Output Saturation Voltage

Note 1 - The output saturation voltage  $V_{DS(on)}$  is measured at  $V_{DD}=3.3V$  and  $V_{DD}=20V$

Note 2 - The device is put under magnetic field with  $B > B_{OP}$

#### Output Leakage Current

Note 1 - The device is put under magnetic field with  $B < B_{RP}$

#### Magnetic Thresholds

Note 1 -  $B_{OP}$  is determined by putting the device under magnetic field swept from  $B_{RPmin}$  up to  $B_{OPmax}$  until the output is switched on.

Note 2 -  $B_{RP}$  is determined by putting the device under magnetic field swept from  $B_{OPmax}$  down to  $B_{RPmin}$  until the output is switched off.
