

4 OUTPUT PCIE GEN1-2-3 SYNTHESIZER

IDT5V41346

Recommended Applications

4 Output synthesizer for PCIe Gen1-2-3

General Description

The IDT5V41346 is a PCIe Gen1/2/3 compliant spread-spectrum-capable clock generator. The device has 4 differential HCSL outputs and can be used in communication or embedded systems to substantially reduce electro-magnetic interference (EMI). The spread amount and output frequency are selectable via select pins.

Output Features

- 4 - HCSL output pairs

Features/Benefits

- 20-pin TSSOP package; small board footprint
- Spread-spectrum capable; reduces EMI
- Outputs can be terminated to LVDS; can drive a wider variety of devices
- Power down pin; greater system power management
- OE control pin; greater system power management
- Spread% and frequency pin selection; no software required to configure device
- Industrial temperature range available; supports demanding embedded applications

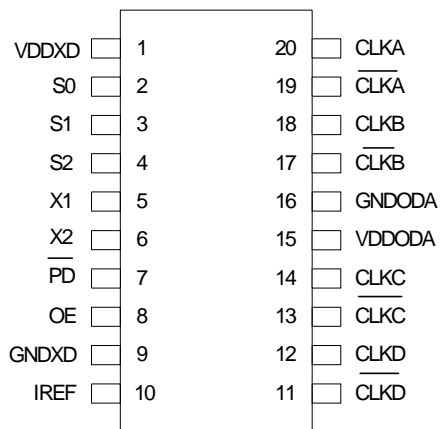

Key Specifications

- Cycle-to-cycle jitter <50 ps
- Output-to-output skew <50 ps
- Low phase noise: 12 kHz to 20 MHz <6ps with spread off
- PCIe Gen1 peak-to-peak phase jitter <86ps
- PCIe Gen2 phase jitter <3.0ps RMS
- PCIe Gen3 phase jitter <1.0ps RMS

Pin Descriptions

Pin	Pin Name	Pin Type	Pin Description
1	VDDXD	Power	Connect to +3.3 V digital supply.
2	S0	Input	Spread spectrum select pin #0. See table above. Internal pull-up resistor.
3	S1	Input	Spread spectrum select pin #1. See table above. Internal pull-up resistor.
4	S2	Input	Spread spectrum select pin #2. See table above. Internal pull-up resistor.
5	X1	Input	Crystal connection. Connect to a fundamental mode crystal or clock input.
6	X2	Output	Crystal connection. Connect to a fundamental mode crystal or leave open.
7	PD	Input	Powers down all PLL's and tri-states outputs when low. Internal pull-up resistor.
8	OE	Input	Provides output on, tri-states output (High = enable outputs; Low = disable outputs). Internal pull-up resistor.
9	GND	Power	Connect to digital ground.
10	IREF	Output	Precision resistor attached to this pin is connected to the internal current reference.
11	CLKD	Output	Selectable 100/200 MHz spread spectrum differential Complement output clock D.
12	CLKD	Output	Selectable 100/200 MHz spread spectrum differential True output clock D.
13	CLKC	Output	Selectable 100/200 MHz spread spectrum differential Complement output clock C.
14	CLKC	Output	Selectable 100/200 MHz spread spectrum differential True output clock C.
15	VDDODA	Power	Connect to +3.3 V analog supply.
16	GND	Power	Connect to analog ground.
17	CLKB	Output	Selectable 100/200 MHz spread spectrum differential Complement output clock B.
18	CLKB	Output	Selectable 100/200 MHz spread spectrum differential True output clock B.
19	CLKA	Output	Selectable 100/200 MHz spread spectrum differential Complement output clock A.
20	CLKA	Output	Selectable 100/200 MHz spread spectrum differential True output clock A.

Application Information

Decoupling Capacitors

As with any high-performance mixed-signal IC, the IDT5V41346 must be isolated from system power supply noise to perform optimally.

Decoupling capacitors of $0.01\mu\text{F}$ must be connected between each VDD and the PCB ground plane.

PCB Layout Recommendations

For optimum device performance and lowest output phase noise, the following guidelines should be observed.

Each $0.01\mu\text{F}$ decoupling capacitor should be mounted on the component side of the board as close to the VDD pin as possible. No vias should be used between decoupling capacitor and VDD pin. The PCB trace to VDD pin should be kept as short as possible, as should the PCB trace to the ground via. Distance of the ferrite bead and bulk decoupling from the device is less critical.

2) An optimum layout is one with all components on the same side of the board, minimizing vias through other signal layers (the ferrite bead and bulk decoupling capacitor can be mounted on the back). Other signal traces should be routed away from the IDT5V41346.

This includes signal traces just underneath the device, or on layers adjacent to the ground plane layer used by the device.

External Components

A minimum number of external components are required for proper operation. Decoupling capacitors of $0.01\mu\text{F}$ should be connected between VDD and GND pairs (1,9 and 15,16) as close to the device as possible.

Current Reference Source R_r (I_{ref})

If board target trace impedance (Z) is 50Ω , then $R_r = 475\Omega$ (1%), providing I_{REF} of 2.32 mA, output current (I_{OH}) is equal to $6 \cdot I_{REF}$.

Load Resistors R_L

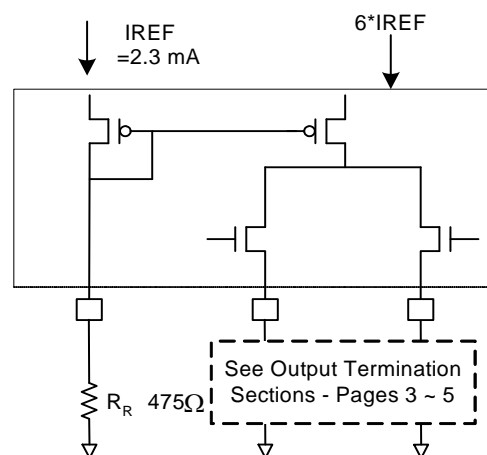

Since the clock outputs are open source outputs, 50 ohm external resistors to ground are to be connected at each clock output.

Output Termination

The PCI-Express differential clock outputs of the IDT5V41346 are open source drivers and require an external series resistor and a resistor to ground. These resistor values and their allowable locations are shown in detail in the **PCI-Express Layout Guidelines** section.

The IDT5V41346 can also be configured for LVDS compatible voltage levels. See the **LVDS Compatible Layout Guidelines** section.

Absolute Maximum Ratings

Stresses above the ratings listed below can cause permanent damage to the IDT5V41346. These ratings are stress ratings only. Functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods can affect product reliability. Electrical parameters are guaranteed only over the recommended operating temperature range.
