DESCRIPTION:

The SSTV16857 is a 14-bit registered buffer designed for 2.3V-2.7V V_{DD} and supports low standby operation. All data inputs and outputs are SSTL_2 level compatible with JEDEC standard for SSTL_2.

$\overline{\text{RESET}}$ is an LVC MOS input since it must operate predictably during the power-up phase. $\overline{\text{RESET}}$, which can be operated independent of CLK and $\overline{\text{CLK}}$, must be held in the low state during power-up in order to ensure predictable outputs (low state) before a stable clock has been applied.

$\overline{\text{RESET}}$, when in the low state, will disable all input receivers, reset all registers, and force all outputs to a low state, before a stable clock has been applied. With inputs held low and a stable clock applied, outputs will remain low during the Low-to-High transition of $\overline{\text{RESET}}$.
