

## Standalone Linear Li-Ion Battery Charger with Thermal Regulation

### ■ General Description

The LN2054 is a complete constant-current /constant-voltage linear charger for single cell lithium-ion batteries. Its ThinSOT package and low external component count make the LN2054 ideally suited for portable applications. Furthermore, the LN2054 is specifically designed to work within USB power specifications.

No external sense resistor is needed, and no blocking diode is required due to the internal MOSFET architecture. Thermal feedback regulates the charge current to limit the die temperature during high power operation or high ambient temperature. The charge voltage is fixed at 4.2V, and the charge current can be programmed externally with a single resistor. The LN2054 automatically terminates the charge cycle when the charge current drops to 1/10<sup>th</sup> the programmed value after the final float voltage is reached. When the input supply (wall adapter or USB supply) is removed, the LN2054 automatically enters a low current state, dropping the battery drain current to less than 2μA. The LN2054 can be put into shutdown mode, reducing the supply current to 2μA.

Other features include charge current monitor, under-voltage lockout, automatic recharge and a status pin to indicate charge termination and the presence of an input voltage.

### ■ Features

- Programmable Charge Current Up to 500mA
- No MOSFET, Sense Resistor or Blocking Diode Required
- Complete Linear Charger in ThinSOT Package for single Cell Lithium-Ion Batteries
- Constant-Current/Constant-Voltage Operation with Thermal Regulation to Maximize Charge Rate Without Risk of Overheating
- Charges Single Cell Li-Ion Batteries Directly from USB Port
- Preset 4.2V Charge Voltage with ±1% Accuracy
- Charge Current Monitor Output for Gas Gauging
- Automatic Recharge
- Charge Status Output Pin
- C/10 Charge Termination
- 2μA Supply Current in Shutdown
- 2.9V Trickle Charge Threshold (LN2054)
- Soft-Start Limits Inrush Current
- Available in 5-Lead SOT-23 and SOT-89 Package

### ■ Applications

- Cellular Telephones, PDAs, MP3 Players
- Charging Docks and Cradles
- Bluetooth Applications

### ■ Package

- SOT-23-5L
- SOT-89-5L

### ■ Typical Application Circuit

NOTE: C1=4.7uF, C2=10uF, IBAT = (VPROG/RPROG)\*1000

## Pin Assignment

Pin Number		Pin Name
SOT-89-5L	SOT-23-5L	
1	1	CHRG
2	2	GND
3	3	BAT
4	4	VIN
5	5	PROG

## Pin Function

**CHRG (Pin 1):** Open-Drain Charge Status Output. When the battery is charging, the CHRG pin is pulled low by an internal N-channel MOSFET. When the charge cycle is completed, a weak pull-down of approximately 20 $\mu$ A is connected to the CHRG pin, indicating an “AC present” condition. When the LN2054 detects an under voltage lockout condition, CHRG is forced high impedance.

**GND (Pin 2):** Ground.

**BAT (Pin 3):** Charge Current Output. Provides charge current to the battery and regulates the final float voltage to 4.2V. An internal precision resistor divider from this pin sets the float voltage which is disconnected in shutdown mode.

**VIN (Pin 4):** Positive Input Supply Voltage. Provides power to the charger. VCC can range from 4.25V to 6.5V and should be bypassed with at least a 1μF capacitor. When VCC drops to within 30mV of the BAT pin voltage, the LN2054 enters shutdown mode, dropping IBAT to less than 2μA.

**PROG (Pin 5):** Charge Current Program, Charge Current Monitor and Shutdown Pin. The charge current is programmed by connecting a 1% resistor, RPROG, to ground. When charging in constant-current mode, this pin servos to 1V. In all modes, the voltage on this pin can be used to measure the charge current using the following formula:

$$IBAT = (VPROG/RPROG) * 1000$$

The PROG pin can also be used to shut down the charger. Disconnecting the program resistor from ground allows a 3μA current to pull the PROG pin high. When it reaches the 1.21V shutdown threshold voltage, the charger enters shutdown mode, charging stops and the input supply current drops to 2μA. This pin is also clamped to approximately 2.4V. Driving this pin to voltages beyond the clamp voltage will draw currents as high as 1.5mA. Reconnecting RPROG to ground will return the charger to normal operation.
